

Interval Limits

By Jens Herrmann (jens.herrmann@pinkeye.de)

This element is already used in some templates for timelines, but its use is not clearly defined. A marker can be used to mark the end and or the beginning of the chart interval, if it is not on a tick of the time axis (x-axis).

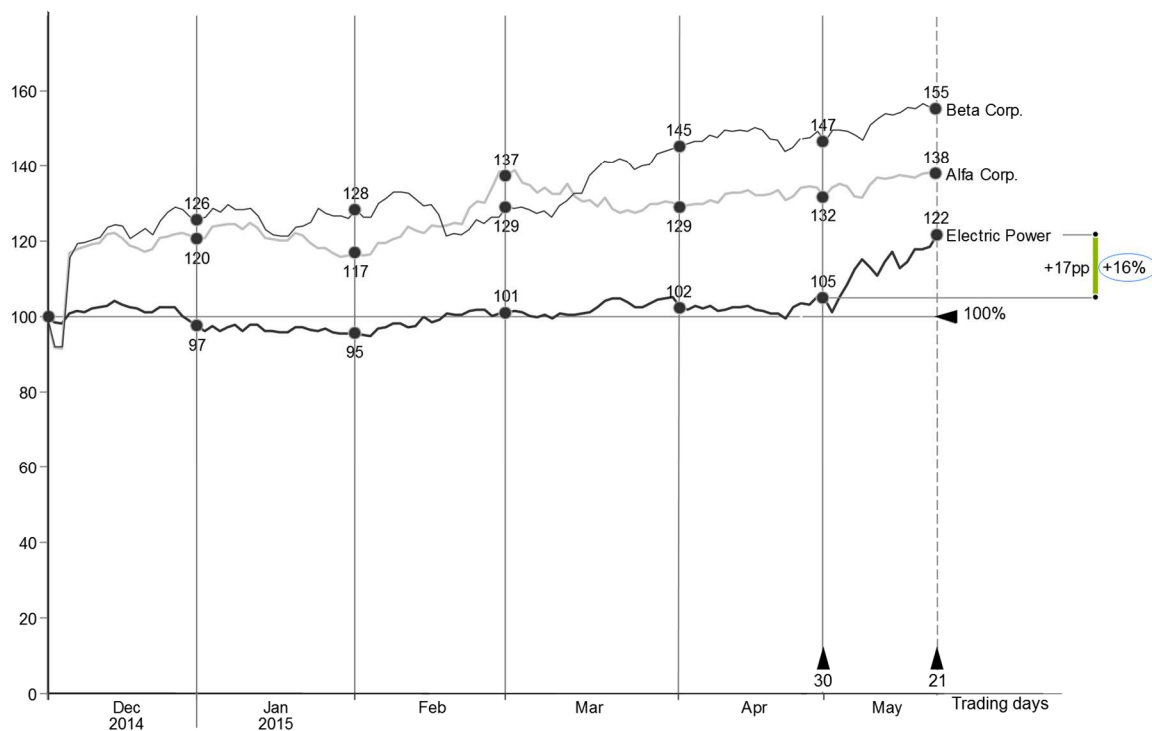

This requires that there are additional data points between the ticks.

The use of markers leads to a better readability despite the possible redundancy to the title.
